The feature: a round-by-round tournament you can step through

Today, the app fetches 16 Pokémon and instantly computes all 120 battle results, then shows the final statistics. The battle logic itself is fine, and you do not need to change how a single battle is decided — it stays:

1. Type advantage, then
2. Higher base experience as the tiebreaker, then
3. A tie if base experience is equal.

Instead, we want to turn the tournament into something the user runs and watches round by round, and can go back and review.

The flow we want

- Start Tournament (button), pick 16 Pokémon, create a tournament, and show all 16 on screen — everyone starting equal (0 wins/losses/ties).
- Process Round (button), resolve one round of the round-robin: the 16 Pokémon are paired into 8 battles, the existing rules decide each battle, and that round's 8 results are shown. Standings update.
- Repeat round by round. Over the full round-robin, every Pokémon eventually plays every other one (16 players: 15 rounds of 8 battles = 120 battles total).
- Review any earlier round or any individual battle after the fact.
- Each Pokémon plays every other exactly once.
- Back end:
    - Keep it in memory, no database. Hold the tournament, its rounds, and every battle result in memory, but structured so a specific round or battle can be fetched back for review.
    - Endpoints. Add what the flow needs, and specifically:
        - Start a tournament (returns the tournament `id` and the 16 selected Pokémon).
        - Process the next round (returns that round's 8 battle results + updated standings).
        - `GET /pokemon/tournament/{id}/battles/{battleId}` → one battle's result for review.
        - `GET /pokemon/tournament/history` → the tournaments run so far
- Front end:
    - Start / Process controls. A Start Tournament button that shows the 16 Pokémon all even at the start, and a Process Round button that advances one round and reveals that round's 8 results.
    - Round-by-round view. Show which pairs fought and who won each round, with running standings across the card grid (the app currently has a single tournament view).
    - Review/history. Let the user go back and look at a previous round or battle, and a history view listing past tournament runs — talking to the new endpoints through a typed service layer.
- Let's pretend you have a couple of customers using the assessment version one. So, any existing API and front end should continue working normally, since this is a new feature to be added to the current project.
